                                                        CC Oligonucleotide which will hybridise under selected comprising an CC Oligonucleotide which will hybridise under selected conditions to Human CC papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, CC 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: CC probe duplex. The present sequence represents a specifically claimed CC helper probe. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these CC from other HPV variants. Papillomaviruses are small DNA viruses and HPV CTypes 16 and/or 18 mucleic acid in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe:target CC and/or 18 can be detected by adding a probe and detecting probe:target CC unlex formation; target nucleic acid is optionally amplified. Type 16 cone specifically claimed PCR primers. For Type 18 detection, a helper CC probe may be used. Oligonucleotides can distinguish target sequences from CC phylogenetically close HPV Types 16 and 18 whilst available detection CC sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Type 16 or 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCR primer. For Type 18 detection, a helper probe may be used. Oligonucleotides can distinguish target sequences from phylogenetically close HPV Types 16 and 18 whilst available detection sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Probes for detection of Human Papillomavirus Type 16 and Type 18 - can distinguish between Type 16 and 18, associated with genital cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human Papillomavirus Type 18 helper probe.

                                                                                                                                                                                                                        Papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 35, 23, 45, 51, 52, or 58) target nucleic acids to form detectable target: probe duplex. The present sequence represents a specifically claimed target sequence. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these from other HPV variants. Papillomaviruses are small DNA viruses and HPV Types 16 and 18 are associated with genital cancers. HPV PCR primers can amplify HPV Type 16 and/or 18 nucleic acid in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe: target duplex formation; target nucleic acid is optionally amplified. Type 16 or 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCR primer. For Type 18 detection, a helper probe may be used. Oligonucleotides can distinguish target sequences from phylogenetically close HPV Types 16 and 18 whilst available detection gera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                           HPV-18 E6 cDNA (given in AAQ97848) was amplified from a HeLa cell cDNA library using the primers given in AAQ97846-47. The gene was subcloned into a baculovirus vector for expression of recombinant E6 in Sf9 insectells for use as a component of an in vitro ubiquitin conjugating syst (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                  Identifying inhibitors of ubiquitin mediated proteolysis of cell cycle regulatory proteins - also new ubiquitin conjugating enzymes, their related nucleic acid, vectors, antibodies etc., useful for regulating e.g. cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ubiquitin-conjugating enzyme; HPV-18 E6 protein; cell proliferation; cancer; psoriasis; fibrosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       25-MAR-2003

                                                                                                                                                                                                                                                                    ঠ
                                                                                                                                                                                                                                                                                                                                                                      This sequence encodes the human papillomavirus E6 protein. The invention C2 relates to assays for identifying an inhibitor of ubiquitin-mediated C2 proteolysis of a cell-cycle regulatory protein comprising contacting a C2 candidate agent with an ubiquitin-conjugating system and measuring the C3 reconstituted protein mixture including a ubiquitin conjugating enzyme C4 reconstituted protein mixture including a ubiquitin conjugating enzyme C5 (UbC8) produced by the expression of a nucleic acid which hybridizes C6 under high stringency conditions to human UbC8, candida albicans UbC8, or C6 chizosaccharomyces pombe UbC8 coding sequences; (b) a regulatory protein c7; and (c) ubiquitin. The polynucleotides are useful for identifying C6 ubiquitination inhibitors. The polynucleotides, polypeptides, antisense C7 compounds and antibodies against them may also be useful for the C6 treatment and/or diagnosis of proliferative disorders (e.g. cancer, C6 atherosclerosis, or restenosis), tissue connective disorders, controlling cound healing, and disorders characterized by fibrosis (e.g. rheumatoid C7 arthritis, insulin dependent diabetes mellitus, glomerulonephritis,
                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  04-JAN-1994;

the protein in the presence of candidate agent an inhibitor of ubiquitin mediated proteolysis of regulatory treating cancers involves measuring ubiquitination levels of in the presence of candidate agent in an eukaryotic cell.

Example 2; Col 97-98; 73pp; English.

CC Candida albicans or Schizosaccharomyces pombe ubiquitin-conjugating CC enzyme (AAB03169-B03171), a cell cycle regulatory protein (such as p53) CC and dechizosaccharomyces pombe ubiquitin-conjugating condidation also discloses novel Candida albicans CC and Schizosaccharomyces pombe ubiquitin-conjugating enzymes, caUDCE and controlled controlled (AAB03170, AAB03171), and two novel human ubiquitin-conjugating CC enzymes, hUDCE and rapUBC (AAB03189, AAB03173). The ubiquitin-mediated CC proteolysis system is the major pathway for the selective, controlled CC controlled controlling the levels of proteins involved in cell cycle important in controlling the levels of proteins involved in cell cycle CC progression. Alterations in the ubiquitination of these proteins may CC therefore play a role in the development of cancers. For example, human CC papillomaviruses such as HPV-18 encode a transforming protein, E6 CC (AAB03176), which combines with a cellular B6-associated protein (E6-AP; CC (AAB03177) to stimulate the ubiquitination of p53, thus targetting it for CC degradation. The ubiquitination inhibitors identified according to the process. They are also useful in treatment of cervical cancers and CC conditions such as psoriasis, neoplastic epidermal conditions, skin C cancers e.g., basal cell carcinomas, squamous cell carcinomas. The cancers are useful for deregulating myc expression and rendering the CC inhibitors are useful for deregulating myc expression and rendering the CC cells sensitive to chemotherapeutic treatment of to uset the balance of transformed cells and cause apoptosis to occur. Inhibitors of ubiquitin-cell cancers and cause apoptosis to occur. Inhibitors of ubiquitin-cells processors of ubiquitin-cells The invention relates to a method of identifying an inhibitor of ubiquitin-mediated proteolysis of a cell cycle regulatory protein comprising contacting an engineered eukaryotic cell with a candidate The eukaryotic cells is engineered to express a recombinant human

                            The invention relates to a novel method for selective post-translational CC silencing in a mammalian cell of the expression of an exogenous gene of cviral origin. The method comprises introducing into the cell a small CC interfering RNA (siRNA) construct that is homologous to a part of the method comprises introducing into the selective post-cc transcriptional silencing of an exogenous gene of viral origin (e.g. an CC compose or human papilloma virus (HPV) gene) in a mammalian cell. The CC method or the siRNA is particularly useful for treating cancer, human CC corvical cancer, human immunodeficiency virus (HIV), smallpox, flu, CC common cold, or a disease caused by a HPV (e.g. genital warte, cervical CC cancer, penile cancer, malignant squamous cell carcinomas or verruca CC vulgaris). An siRNA construct or vector is useful for use as a medicament CC compon the diseases mentioned. The polynucleotide sequence of the invention CC can be used to treat disorders by gene therapy. This polynucleotide cotted invention CC can cer represents the DNA of a HPV siRNA sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                               Matches
                                                                                                                                               The present sequence encodes an E6 polypeptides from human papillomavirus type 18 (HPV18). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 33 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          E6 protein; E7 protein; fusion protein; HPV16; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer; anal cancer; reproductive system cancer; penile cancer; vulvar cancer;

                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method and composition comprising a transfer agent and a solid or colloidal carrier medium for delivering biological agents into cells. The invention is useful for the treatment of cancer, tumor, carcinoma of cuttaneous, squamous or cervical ppithelia and colorectal carcinoma, wounds, burns and scars. The invention is also useful in gene therapy. The present sequence is the human papillomavirus type 18 E6/E7 gene fragment. This sequence is useful in a method for

Probes and primers based on these sequences were used for HPV infection diagnosis; expression of E6 and E7 is diagnostic for cervical cancer or pre- malignant states. Recombinant virus vectors encoding human papillomavirus proteins - for treating and vaccinating against HPV infections and conditions caused them, such as cervical cancer.

à

Disclosure; Fig 1b; 83pp; English

XFFFXXXXDDDDDDDDDDDDXXX

The fragment of DNA contg. the HPV-18 B6/E7 coding region was prepd. by PCR from plasmid pBR322/HPV18 (Boshart et al., EMBO J. 3; 1151) using oligonucleotides SO1 and SO2. The DNA prod. has a site for NcoI at the beginning of the E6 gene and a SmaI site immediately downstream of the termination codon for E7. The E6 and E7 ORFs are fused together to form a single continuous ORF via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-18 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherapeutically to activate cells of the immune system against HPV. See also AAQ29385-400 and AAQ29450-69. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                           This sequence represents the coding region for a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked the an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                      The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyra protein (CLyra) or thioredoxin. The present sequence encodes an HPV-H. influenzae D protein, fusion protein of the

The present invention relates to a method (MI) for promoting highly efficient antigen presentation in a mammal, by targeting a preselected condition to an endocytic receptor on an antigen-presenting cell, e.g. a condition of a dendritic cell is the cell endocytic receptor DEC-205. The method comprises exposing dendritic cells from the command to either: a conjugate comprising a preselected antigen covalently bound to an antibody to DEC-205, or a recombinant anti-DEC-205 antibody (genetically engineered to contain at least one preselected antigen on at comprision of the dendritic cells. The sequence encoding an anti-DEC-205 antibody (fragment) is preferably selected from ADV85632 and ADV85633, which encode the heavy or light chain variable region of an anti-DEC-205 antibody. The antigen is targeted to antigen presenting cells through the condition of the anti-DEC-205 antibody, making antigen presentation for immunizing a mammal to prevent or treat a disease such as a condition of single dose at low concentration. The method of the invention is consecuted by acceptably results in induction of cancer. The immunization condition is preferably results in induction of cancer. The immunization of conditions are conditions. The present sequence is a HPV DNA sequence which encodes the E6 and E7 proteins. The present sequence can be used as a vaccine antigen.

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for

The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an B6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptcococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence encodes an HPV-H. influenzae D protein, fusion protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human

                                                                                                                                        The invention comprises a composition for the detection of cancer markers, the composition contains a nucleic acid molecule which is substantially identical to a full length genomic clone of a human papilloma virus (type 11, 16, 18, 51, 56, 58, 66, 70, or 73). The composition of the invention is useful for diagnosing cancer or the risk of developing cancer, in particular cervical, anal, colon and HPV-related cancer. The present DNA sequence represents a human papilloma virus full length genomic clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1731 BP; 610 A; 313 C; 403 G; 405 T; 0 U; 0 Other;

                                                                                                                                                  The present sequence encodes an E6 polypeptides from human papillomavirus type 45 (HPV45). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids corresponding to amino acids 30 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV) -associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  E6 protein; E7 protein; fusion protein; HPV45; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer; anal cancer; reproductive system cancer; penile cancer; vulvar cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes an B6 polypeptides from human papillomavirus type 68 (HPV68). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 30 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the polypeptide in the cancer of the concert and other cancers of the concert and other cancers of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the cancer of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a human papillomavirus (HPV) 68 DNA sequence. The invention relates to a purified HPV68 DNA (I) deposited at C.N.C.M. (Collection Nationale de Culture de Microorganisms) under Accession No. I -1540, and a HPV70 DNA (II) sequence. Fragments of the HPV68 and HPV70 DNA may be useful as primers or probes in the detection of HPV68 or HPV70 infections. Proteins produced by the HPV DNA's can be used to immunise animals against HPV68 or HPV70 infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human papillomavirus (HPV) treatment of HPV infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence encodes the E6 and E7 proteins of human papillomavirus (HPV) 68. The invention relates to a purified HPV68 DNA (I) deposited at C.N.C.M. (Collection Nationale de Culture de Microorganisms) under Accession No. I-1540, and a HPV70 DNA (II) sequence. Fragments of the HPV68 and HPV70 DNA may be useful as primers or probes in the detection of HPV68 or HPV70 infections. Proteins produced by the HPV DNA's can be used to immunise animals against HPV68 or HPV70 infections
                                                                                                                                                                                      This sequence represents a human papillomavirus (HPV) 70 DNA sequence. The invention relates to a purified HPV68 DNA (I) deposited at C.N.C.M. (Collection Nationale de Culture de Microorganisms) under Accession No. -1540, and a HPV70 DNA (II) sequence. Fragments of the HPV68 and HPV70 DNA may be useful as primers or probes in the detection of HPV68 or HPV7 infections. Proteins produced by the HPV DNA's can be used to immunise
                                                                                                           Sequence 3283 BP; 945 A; 640 C; 699 G; 999 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              24-OCT-2003
25-MAR-2003
18-JAN-1993
DNA was isolated from a previously identified HPV39 clone (Virology 374-384, 1987), subcloned and sequenced. The HPV39 genome was found comprise 7833bp and have a G/C content of 40%. The genome comprises reading frames conserved among all the known HPV's; the ORFs are postulated to code for the early proteins and capsid components of t
                                                                                                                                                                                                    DNA sequences of the HPV39 Papilloma:virus genome - in=vitro diagnosis of Papilloma:virus infections in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of the genome (see features table). The non-coding regions contain three complete copies of an HPV enhancer as well as two degenerate versions of the consensus palindrome (location not given). Other putative features which are described in the specification as being present within the reulatory region but whose positions are not given include: 4 nuclear factor-1 binding sites, 2 activation protein-1 binding sites, a papillomavirus enhancer associated factor binding site and a glucocorticoid response element. The HPV39 sequence has most homology with HPV18. The HPV39 is thought to belong to a sub-group of genital HPVs (with HPV18, HPV45 and a new type cloned from carcinoma MEX180 cell line) representing a potential oncogene. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                The invention comprises a composition for the detection of cancer markers, the composition contains a nucleic acid molecule which is substantially identical to a full length genomic clone of a human papilloma virus (type 11, 16, 18, 51, 56, 58, 66, 70, or 73). The composition of the invention is useful for diagnosing cancer or the risk of developing cancer, in particular cervical, anal, colon and HPV-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               07-OCT-2003; 2003DK-00001474.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cancer; cell proliferative disorder; autoimmune disorder; inflammatory disorder; infection; hormonal disorder; metabolic disorder; neurological disorder; gastrointestinal disorder; transport disorder; connective tissue disorder; drug screening; proteome analysis; gene therapy; antisense therapy; genotyping; transgenic animal; knock in; disease model; toxicological testing; transcript imaging;
              The invention relates to novel human diagnostic and therapeutic polynucleotides designated dithp (ACC46080-ACC46749) and to their encode protesins (DITHP, ABR41136-ABR41812). The invention also relates to polynucleotide sequences at least 90% identical to the dithp cDNA sequences of the invention, recombinant vectors, host cells and transgenic organisms comprising a dithp nucleic acid sequence; the recombinant production of DITHP proteins; antibodies specific for DITHP
                                                                                                                                                                Novel human diagnostic and therapeutic polypeptide useful for identifying test compound which specifically binds to a polypeptide encoded by human diagnostic and therapeutic polynucleotide, and to induce antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human dithp ribosomal protein-encoding cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC detecting dithp nucleotide and protein sequences; methods of screening CC for compounds which specifically bind a DITHP protein; and methods of CC assessing the toxicity of test compounds using a dithip hybridisation CC probe. Dithip nucleic acid sequences and DITHP proteins may be used in the CC proliferative disorders; autoimmune or inflammatory disorders; betterial, CC viral, fungal or parasitic infections; hormonal disorders; metabolic CC disorders; neurological disorders; paratrointestinal disorders; transport CC disorders; and connective tissue disorders. They may also be used to cC screen for modulators of protein activity or gene expression. DITHP proteins can additionally be used in analysis of the proteome of a tissue CC or cell type and to induce antibodies. The dith pucleic acids are CC additionally useful in somatic or germline gene therapy of the disorders CC mentioned above, as a source of antisense sequences, as a source of probes and primers, in genotyping and identification of individuals, in CC the generation of transgenic animal models of human disease or knock in the present sequence represents a dithp CDNA encoding a DITHP protein activity or generation of the printed specification, but was obtained in CC electronic format directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this patent directly from WIPO at the sequence data for this p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC of a compound or progression of a toxic effect, preferably the CC hepatotoxicity of a compound, comprising detecting the level of CC expression in a tissue or cell sample exposed to the compound of two or CC more genes listed in the specification, where differential expression of CC the genes is indicative of at least one toxic effect or progression. The CC method can also be used to identify an agent which modulates the toxic CC response and predict cellular pathways that a compound modulates in a CC cell. The methods utilise a set of at least two probes (on a solid CC support in kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer CC system comprising a database containing information identifying the expression level in a tissue or cell sample exposed to a hepatotoxin of a CC cand a user interface to view the information used to present information identifying the expression level in a tissue or cell of at least one gene listed in the specification, a computer CC changes in gene expression and for identifying toxicity markers in CC changes in dene expression and for identifying toxicity markers in CC cissues or cell exposed to a known toxin. The genes may be used as concity markers in the specification of the physiological state of tissue or cell sample that has been exposed to a compound or agent. Hepatotoxicity is characterised by centrilobular necrosis and steatosis. The present CC characterised by centrilobular necrosis and steatosis. The present constitution is differentially expressed in response to a hepatotoxic agent which is differentially expressed in response to a hepatotoxic agent constitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

CC dysphas, cardiogenic shock or other specific heart pathologies. The CC invention is based on the elucidation of global changes in gene CC expression in tissues or cells exposed to known toxins, particularly CC cardiotoxins, and the identification of individual genes (toxicity CC markers) that are differentially expressed on toxin exposure. The CC invention also relates to methods for predicting the progression of a CC compound's toxic effects, for predicting the cardiotoxicity of a CC compound, for identifying an agent that modulates the onset or CC pathways a particular compound will modulate. The invention further CC relates to sets of at least two hybridization probes specific for CC compounds such as pharmaceutical supports and kits comprising them. CC relates to sets of at least two hybridization probes specific for CC predicting the toxic effects (especially cardiotoxic effects) of CC compounds such as pharmaceutical agents or environmental pollutants. CC sequences ADV9313-ADV41830 represent cardiotoxic effects) of CC sequences ADV9313-ADV41830 represent cardiotoxic three on exposure to at least one cardiotoxin. Note: The sequence data for this patent did not form part directly from MIDD at fire introduction is altered on exposure to form part directly from MIDD at fire introduction obtained in electronic CC forms directly from MIDD at fire introduction but was obtained in electronic CC form at directly from MIDD at fire introduction.
                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of predicting at least one toxic effect of a compound by obtaining a gene expression profile of a tissue or cell sample exposed to the compound and comparing the gene expression profile to a database of toxicity prediction genes which are differentially expressed on exposure to known toxins. The tissue or cell sample is preferably derived from heart tissue, and the predicted toxic effect is especially a cardiotoxic effect such as myocarditis, arrhythmias, tachycardia, myocardial ischemia, angina, hypertension, hypotension, dyspnea, cardiogenic shock or other specific heart pathologies. The invention is based on the allocation of the prediction of the comparison of the com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mendrick

30-AUG-2001

```
The invention relates to polynucleotides (I) encoding diagnostic and therapeutic (DITHP) polypeptides (II), which include e.g. enzymes, and CC proteins involved in growth and development and receptors. (I) and (II) cmay be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate DITHP expression. For example, (I) and (II) may be used to treat disorders associated with decreased polypeptide conversion by rectifying mutations or deletions in a patient's genome, that affect the activity of the DITHPs, by expressing inactive proteins convergence or supplementing the patient's own production of them. (I) and (II) may be used to treat diseases, for example, cell proliferative disorder, CC crohn's disease, acquired immune deficiency syndrome (AIDS), lymphoma, convergence and convergence as and respiratory disorders. Additionally, cell may be used to produce the DITHPs, by inserting the nucleic acids in the complementary sequences may also be used as DNA probes in diagnostic casesys to detect and quantitate the presence of similar nucleic acids in the charactery and therefore which patients may be in need of restorative convergence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antibodies against DITHPs and in assays to identify modulators of DITHP expression and activity. The anti-DITHP antibodies and antagonists may also be used to down regulate expression and activity. The anti-DITHP antibodies may also be used as diagnostic agents for detecting the presence of DITHPs in samples (e.g. by enzyme linked immunosorbant assay (BITAN)). AAS30986-AAS31196 represent human diagnostic and therapeutic
                                                                                                    AAT71194-T71199 are probes used for the detection of spliced exons human papillomavirus (HPV) types 16, 18, 31, 33 and 35. The probes specifically hybridise to E6 region exons at the splice junction of spliced HPV genome. The probes are used for accurate and reliable prognosis of HPV-induced cancers, in particular cervical cancer. (to on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention is in a process for exponentially amplifying a nucleic acid sequence by a single unpaired primer. It includes a method for modifying a putative primer to improve its ability to prime a single primer exponential amplification process. Oligo amino modifications to the 5' end occurred at the last coupling step. The resulting 5' modified oligos all contained a six carbon spacer arm to the amino gp., designated (C6, NH2). Oligo Ru(II) modifications to the 5' end occurred at the last coupling step and the oligo is designated Ru(II) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 30 BP; 10 A; 7 C; 4 G; 9 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amplifying nucleic acid sequences of interest - using single primer provide exponential amplification in polymerase reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-DEC-1992;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence of directed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            25-MAR-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides a binding assay based on measuring CC electrochemiluminescence from a luminescent component concentrated in an electrochemiluminescence from a luminescence for detection. The CC assay composition which is collected at an electrode for detection. The CC inding assay is used to measure luminescence emitted by one or more CC labeled components of the assay system. The assay can be used to measure CC e.g. antigen-antibody, ligand-receptor, RNA and DNA interactions. The CC e.g. antigen and the analyte of interest may be e.g. a whole cell, where CC sample may be derived from cells, water, feces, saliva, tissue, hair, CC sweat or urine and the analyte of interest may be e.g. a whole cell, Burface antigen, subcellular particle, virus, antibody, antigen, hapten, CC surface antigen, burmone, nucleic acid, vitamin, amino acid, sugar, CC polysaccharide, hormone, nucleic acid, vitamin, amino acid, sugar, CC molecule. The assay has improved sensitivity, faster assay time, greater specificity, lower detection limits and greater precision than previous methods. Sequences AAZO7818-823 represent PCR oligos directed to the HPV CC E6 region, used during the course of the invention

                                                                                                                                                                                   Human
                                                                                                                                                                                                                                                                                                                                                                                                                                               composition suitable for use in electrochemiluminescent assay for analyte of interest which comprises electrochemiluminescent label binding reagents, collectable magnetic particles particles electrolyte. The present sequence is the human papillomavirus (HPV) B6 region specific PCR primer. This sequence was used in a binding assay for an analyte of interest present in a sample based upon electrochemiluminescence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Electrochemiluminescent composition useful in assay for analyte e.g., virus, comprises electrochemiluminescent label, first and second binding reagents having binding partners of analyte, collectable magnetic particles and electrolyte.
                                                                                                                                                                                                             13-SEP-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cc gene expression (comprising a plurality of single exon nucleic acid comprobes cited above, where each of the plurality of probes is separately cc and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of cc exon microarray for measuring human gene expression, a vector comprising the single exon probe cited above, an ORF-encoded peptide comprising at least gc contiguous amino acids of any of the above-mentioned amino acid sequences (optionally with conservative amino acid substitutions), an cc isolated antibody that binds specifically to a peptide cited above, comethods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing human gene expression data by subscription, and a computer-readable storage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probes may be used as tools for surveying to spression analysis. The probes may be used as tools for surveying to spression analysis. The probes may be used as tools for surveying to spression, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising alternations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human cc single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USFO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II)

Sequences. (I) is useful as hybridisation probes, polymerase chain

CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,

CC and in recombinant production of (II). The polynucleotides are also used

CC in diagnostics as expressed sequence tags for identifying expressed

CC genes. (I) is useful in gene therapy techniques to restore normal

CC activity of (II) or to treat disease states involving (II). (II) is

CC useful for generating antibodies against it, detecting or quantitating a

CC polypeptide in tissue, as molecular weight markers and as a food

CC supplement. (II) and its binding partners are useful in medical imaging

CC involving aberrant protein expression or biological activity. The

CC involving aberrant protein expression or biological activity. The

CC olignostics forensics, gene mapping, identification of mutations

CC diagnostics forensics, gene mapping, identification of mutations

CC end to produce other types of data and products dependent on DNA and

CC and to produce other types of data and products dependent on DNA and

CC and in oacid sequences. AAS64197-AAS94564 represent novel human diagnostic

CC coding sequences of the invention. Note: The sequence data for this

CC patent did not appear in the printed specification, but was obtained in

CC electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe; microarray; genetic disorder; s

                                           The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease, Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; gene expression; heart; microarray; vascular system; probe; cardiovascular disease; hypertension; cardiac arrhythmia; congenital heart disease; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
